

The MagentIQ Build Challenge: The AI Agent Pilot

1 Overview

At magentIQ, we build intelligent systems that work for people. To prepare for your interview on **May 4, 2026**, we want you to build a functional **AI Agent** using **n8n**.

You will have **20 –30 minutes** during your recruitment session to present your work. We aren't looking for perfection—we're looking for logic, curiosity, and the ability to explain *how* your automation / AI Agent works.

2 The Technical Requirements (Free Tier Only)

You must use the following tools to ensure your project is accessible and cost-free:

1. **Automation Platform:** n8n (Sign up for a free cloud trial or use the Desktop app).
2. **The Brain (LLM):** Connect your agent to an AI model. We recommend using the **Google Gemini API** (via Google AI Studio) Or a LLM of your choice, many offer excellent free developer tiers.
3. **The Interface:** How do we talk to your agent? You can use a **Webhook**, **email**, or an **n8n Form**.

3 Choose your Challenge Path

Select one of the three options below or create your own "Wildcard" idea.

Option A: The Smart Triage Agent

- Build an agent that receives a "Customer Support Ticket" via a form or email. The agent should:
- Analyze the **sentiment** (Is the customer frustrated or happy?).
- Categorize the issue (Technical, Billing, or Feedback).
- Draft a customized response based on the category and sentiment.

Option B: The "Research Hero" Agent

Build an agent that takes a simple topic (e.g., "The future of AI in 2026") and:

- Uses a search tool or its own knowledge to find 3 key facts.
- Summarizes the information into a "Bullet Point Briefing."
- Sends that briefing to a destination of your choice (Email, Slack, or Google Sheets).

Option C: The Personal Productivity Agent

Build an agent that helps manage a busy day. For example:

- An agent that turns a messy paragraph of notes into a clean "To-Do List."
- An agent that translates a message into three different languages automatically.

4 Your 20–30 Minute Demo Structure

During the event in Cebu, you will present your work and walk us through:

1. **The Problem (2 – 5 mins):** What does your agent do and why did you choose this?
2. **The Architecture (10 – 15 mins):** Show us your n8n canvas. Explain why you chose specific nodes and how you set up your AI prompts.
3. **The Live Run (5 mins):** Trigger the agent live and show us the result.
4. **Growth Mindset (3 – 5 mins):** If you had a \$1,000 budget and a week of time, how would you improve this agent with the aim of making it sellable to customers?

5 Submission Checklist

- ☐ Your n8n workflow is ready to run.
- ☐ You have your API key(s) active and tested.
- ☐ You are prepared to explain your "Prompt Engineering" (the instructions you gave the AI).
- ☐ You have an idea on how you could or would expand your submission further.

Pro Tip: We value **documentation**. If you bring a short README or a diagram explaining your logic, you'll already be standing out.

6 Final Tips for Success

- **Keep it simple:** A reliable agent that does one thing perfectly is better than a complex one that breaks.
- **Debug openly:** If something doesn't work perfectly during the demo, don't panic! Explain *why* you think it's failing—that's what real developers do.
- **Be Creative:** We love seeing "Wildcard" ideas that solve unique, real-world problems.

Good luck, and we'll see you in Cebu!
